

Question #1 of 76

Question ID: 1473253

Assuming that the growth rate is less than the required rate of return (r), an increase in return on equity (ROE) will cause value in a residual income (RI) model to:

- A) increase if ROE is greater than the required rate of return.
- B) there is insufficient information to derive the effects of increasing ROE on RI.
- C) decrease if ROE is greater than the required rate of return.

Question #2 of 76

Question ID: 1473242

Economic value added (EVA[®]) is calculated as net operating profit after taxes minus:

- A) a charge for total capital.
- B) capital expenditures.
- C) a charge for equity capital.

You are the chairperson of the board of Retty Inc. You are reviewing the statistics on management performance over the past three years.

The accounts of the firm are summarized below:

Exhibit 1: Income Statement

	20x4	20x5	20x6
	\$m	\$m	\$m
Sales	40.2	42.3	43.9
Cost of goods sold (11.6) (12.3) (12.8)	<u>(11.6)</u>	<u>(12.3)</u>	<u>(12.8)</u>
Gross profit	28.6	30.0	31.1

Administrative expenses	<u>(10.0)</u>	<u>(10.0)</u>	<u>(3.0)</u>
Earnings before interest and tax	18.6	20.0	28.1
Interest	<u>(6.3)</u>	<u>(6.3)</u>	<u>(4.2)</u>
Earnings before tax	12.3	13.7	23.9
Tax	<u>(5.1)</u>	<u>(5.6)</u>	<u>(11.4)</u>
Net income	7.2	8.1	12.5
Dividends	<u>(3.0)</u>	<u>(3.1)</u>	<u>(3.2)</u>
Retained income	4.2	5.0	9.3

Exhibit 2: Balance Sheet at 31 December

	20x3	20x4	20x5	20x6
	\$m	\$m	\$m	\$m
Total assets	<u>100.0</u>	<u>104.2</u>	<u>109.2</u>	<u>110.5</u>
Liabilities	24.0	24.0	24.0	16.0
Common stock	20.0	20.0	20.0	20.0
Additional paid up capital	10.0	10.0	10.0	10.0
Retained income	<u>46.0</u>	<u>50.2</u>	<u>55.2</u>	<u>64.5</u>
	<u>100.0</u>	<u>104.2</u>	<u>109.2</u>	<u>110.5</u>

Market value of equity (31 December) 167 203 199 145

- Beta of firm = 1
- Debt holders' required rate of return: 5%
- Equity holders' required rate of return: 15%
- After tax WACC: 12.5%
- Tax rate: 45%

Notes:

1. Administrative expenses include goodwill write downs of \$7m in 20x4 and 20x5—
goodwill is fully written off by the end of 20x5
2. \$8m of debt was redeemed at the start of 20x6
3. Other than the debt redeemed in 20x6, the liabilities consist mostly of long-term debt
valued approximately at book value
4. Replacement value of assets is roughly equal to book value minus 4%

Question #3 - 8 of 76

Question ID: 1473259

Calculate the "traditional" measure of Return on (opening) Equity for 20x6.

- A)** 10.9%.
 - B)** 13.2%.
 - C)** 14.7%.
-

Question #4 - 8 of 76

Question ID: 1473260

Calculate Retty's EVA[®] for 20x6 based on end-of-year invested capital. (Ignore the potential problem created by the write-off of goodwill.)

- A)** \$1.3 million negative.
 - B)** \$1.2 million negative.
 - C)** \$1.6 million positive.
-

Question #5 - 8 of 76

Question ID: 1530463

Calculate Retty's residual income for 20x6.

- A)** -\$0.3 million.
 - B)** \$0.7 million.
 - C)** \$2.5 million.
-

Question #6 - 8 of 76

Question ID: 1473262

Calculate Retty's Market Value Added (MVA) for 20x6.

- A)** \$9.3 million.
 - B)** \$12.5 million.
 - C)** \$50.5 million.
-

Question #7 - 8 of 76

Question ID: 1473263

Which of the following statements would be most likely to explain a decrease in MVA for 20x7?

- A)** The market expectation is that Retty's results will show an underperformance relative to its sector.
 - B)** In 20x6 the management produce negative Economic Value Added (EVA[®]).
 - C)** The market expectation is that Retty's future Economic Value Added (EVA[®]) is lower than the previous expectation.
-

Question #8 - 8 of 76

Question ID: 1473264

The chairman has drawn up budgetary forecasts for 20x7 that suggest residual income will be \$5m for the year ahead. Management plans for the medium term lead you to believe that this will increase by 5% per annum for the foreseeable future. Using the residual income method, value Retty's equity as at 31st December 20x6.

- A) \$144.5 million.
 - B) \$147.0 million.
 - C) \$177.2 million.
-

Pedro Fernandez, CFA, is part of a team of analysts working for DAB Inc. He is currently analyzing the equity value of Silo Inc., which he believes is under threat of takeover by its main rival Cart Inc. Fernandez decides to use a residual income model to value the company using the following information:

Silo Inc. is expecting a return on equity (ROE) of 14% over each of the next four years. Its current book value is \$8.00 per share. Its dividend payout ratio is 40%. The required return on equity is 11%. Forecasted earnings in years 1 through 4 are equal to ROE times the beginning book value.

Fernandez is concerned over what persistence factor to use for the residual income valuation and so consults his colleague Oliver Chippy who makes the following comments:

Comment 1: The persistence factor needs to be between -1 and +1.

Comment 2: The persistence factor will be higher if there is a high dividend payout ratio and historically high residual income persistence in the industry.

As part of the valuation exercise Fernandez consults DAB's valuation handbook, which outlines when it is appropriate to use the residual income method and some of the necessary adjustments:

Due to the clean surplus violation, it is important to adjust net income for items that are charged directly to shareholders' equity. Such items include
Statement 1: foreign currency translation gains and losses under the all- current method.
If this cumulative translation adjustment (CTA) does not reverse over time then ROE can be forecasted without taking in to account the CTA.

The residual income model is appropriate when the terminal value forecast
Statement 2: is highly uncertain and the expected free cash flows are negative for the foreseeable future.

Calculate the intrinsic value of the company using a residual income model, assuming that after four years, Silo's residual income will decay over time to zero with a persistence factor of 0.3.

- A) \$8.9.
 - B) \$9.2.
 - C) \$8.1.
-

Question #10 - 12 of 76

Question ID: 1473306

Calculate the intrinsic value of the company using a residual income model, assuming that after four years, Silo's residual income will remain constant forever.

- A) \$8.8.
 - B) \$11.4.
 - C) \$10.7.
-

Question #11 - 12 of 76

Question ID: 1473307

Regarding Oliver Chippy's comments on persistence factors:

Comment 1

Comment 2

- | | |
|--------------|-----------|
| A) Incorrect | Correct |
| B) Incorrect | Incorrect |
| C) Correct | Incorrect |
-

Question #12 - 12 of 76

Question ID: 1473308

Regarding the handbook's statements on residual income:

Statement 1

Statement 2

- | | |
|--------------|-----------|
| A) Correct | Correct |
| B) Correct | Incorrect |
| C) Incorrect | Correct |
-

Question #13 of 76

Question ID: 1473275

The present value of Forman Electronics' projected residual income (RI) for the next five years is £80 per share. Beyond that time horizon a key analyst projects that the firm will sustain a RI of £17 per share, which is the RI for year 5. Given a cost of equity of 13%, what is the terminal value of the stock as of year 5?

- A) £500.00.
 - B) £19.96.
 - C) £130.77.
-

Question #14 of 76

Question ID: 1473288

Analyst Brett Melton, CFA, is looking at two companies. Happy Cow Dairies has volatile cash flows, and its free cash flow is often negative. The company pays no dividends. Glitter and Gold, a maker of girls' clothing, has a fairly steady stream of earnings and cash flows but takes a lot of charges against equity. Is the residual income model suitable for valuing the two companies?

Happy Cow
Dairies

Glitter and Gold

- | | |
|--------|-----|
| A) No | No |
| B) No | Yes |
| C) Yes | No |
-

Question #15 of 76

Question ID: 1473251

Krieger String & Twine expects to generate a return on equity (ROE) of 13.6% in each of the next five years. The required ROE is 8.7%. Current book value is \$12.40 per share and the firm pays no dividends. Krieger previously assumed residual income falls to zero immediately after five years, but has now decided to recalculate its estimated value using a persistence factor of 35%. The difference between the new valuation and the old one is *closest* to:

- A)** \$0.64 per share.
 - B)** \$0.16 per share.
 - C)** \$0.32 per share.
-

Question #16 of 76

Question ID: 1473269

An analyst is considering the purchase of Rylinks, Inc., which has a price to book value (P/B) ratio of 6.00. Return on equity (ROE) is expected to be 13%, current book value per share is \$13.00, and the cost of equity is 11%. What growth rate is implied by the current P/B rate?

- A)** 11.00%.
 - B)** 10.60%.
 - C)** 0.40%.
-

Question #17 of 76

Question ID: 1473279

A use of the residual income (RI) valuation approach is:

- A)** providing a check of consistency between competing approaches like free cash flow of equity (FCFE) and dividend discount model (DDM).
 - B)** deferring value more than in competing valuation approaches.
 - C)** providing more reliable estimates of terminal value.
-

Question #18 of 76

Question ID: 1473268

An investor is considering the purchase of Robust Econometrics, Inc., which has a price-to-book (P/B) value ratio of 4.50. Return on equity (ROE) is expected to be 14%, the current book value per share (BVPS) is \$22.50, and the cost of equity is 12%. The growth rate implied by the current P/B ratio is *closest* to:

- A) 12.57%.
 - B) 11.43%.
 - C) 8.00%.
-

Question #19 of 76

Question ID: 1473265

Midland Semiconductor has a book value of \$10.50 per share. The company's return on equity is 20%, and its required return on equity is 17%. The dividend payout ratio is 30%. What is the value of the shares using a single-stage residual income model?

- A) \$31.50.
 - B) \$21.00.
 - C) \$10.50.
-

Question #20 of 76

Question ID: 1473284

The residual income approach is appropriate when:

- A) a firm pays high dividends that are quite stable.
 - B) the clean surplus accounting relation is violated significantly.
 - C) expected free cash flows are negative for the foreseeable future.
-

Question #21 of 76

Question ID: 1473267

Big Sky Ranches reported the following for the end of its fiscal year:

- Revenues = \$40.8 million.
- Pretax income = \$8.6 million.
- (beginning-of-the year) Assets = \$53.2 million.
- (beginning-of-the year) Liabilities = \$27.8 million.
- Dividends per share = \$0.35.
- Shares outstanding = 8 million.
- Tax rate = 35%.

The beta for Big Sky Ranches is 1.2, the current risk-free rate is 4.5%, and the expected return on the market is 12.5%. What is the value of the shares using a single-stage residual income model?

- A)** \$11.28.
 - B)** \$23.23.
 - C)** \$8.10.
-

Question #22 of 76

Question ID: 1473277

The present value of GB Industries' projected residual income (RI) for the next five years is 70 per share. Beyond that time horizon, a key analyst projects that the firm will sustain a RI of 15 per share, which is the RI for year 5. Given a cost of equity of 12%, what is the terminal value of the stock as of year 5?

- A)** £560.00.
 - B)** £125.00.
 - C)** £500.00.
-

Question #23 of 76

Question ID: 1473249

Brown Manufacturing's recent financial statements reported a book value of \$9.50 per share; its required rate of return is 10%. Analyst Tony Giancola, CFA, wants to calculate the company's intrinsic value using a multistage residual income with a high-growth RI for the next 5 years. Giancola creates the following estimates:

- PV of interim high-growth RI for the next 5 years is \$3.10
- At the end of year 5, the PV of continuing RI is \$10.00
- Estimated Book Value in 5 years is \$25.00

Which of the following is *closest* to the current intrinsic value of Brown Manufacturing?

- A)** \$18.81.
 - B)** \$22.60.
 - C)** \$13.10.
-

Question #24 of 76

Question ID: 1473237

Cognitive Products (CP) designs decision-making software. The book value of its assets is \$3.2 billion, which is financed with \$2.0 billion in equity and \$1.2 billion in debt. Its before-tax cost of debt is 6.5%, while its relevant tax rate is 34%. CP has a cost of equity of 12.46%. Its abbreviated income statement is:

Earnings before interest and taxes (EBIT)	\$213,000,000
Interest expense	(30,000,000)
Pretax income	183,000,000
Income tax expense	(62,220,000)
Net income	\$120,780,000

The residual income (RI) for CP is *closest* to:

- A)** – \$128,369,000.
 - B)** – \$128,420,000.
 - C)** – \$128,471,000.
-

Question #25 of 76

Question ID: 1473289

In general, firms making aggressive accounting decisions will report book values that are:

- A)** lower.
 - B)** higher.
 - C)** consistent with fair market value.
-

Question #26 of 76

Question ID: 1473273

The total cumulative present value of Raver Industries' projected residual income (RI) over the next five years is £60 per share. Beyond that time horizon, a key analyst projects that the firm will sustain a RI of £11 per share, which is the RI for year 5. Given a cost of equity of 12%, what is the terminal value of the stock as of year 5?

- A)** £560.00.
 - B)** £91.67.
 - C)** £500.00.
-

Question #27 of 76

Question ID: 1473281

An argument for using the residual income (RI) valuation approach is that residual income valuation:

- A)** facilitates comparisons between divisions.
 - B)** encourages company managers to maximize ROI.
 - C)** reduces the problem of terminal value dominating total value.
-

Jon Binkster, CFA, has decided to determine the value of the equity in Busicomb Inc. using the residual income method. Binkster has obtained financial statements for the year ended December 20x5. These financial statements are included in Exhibits 1–3 below.

Exhibit 1**Busicomb Inc. Annual Income Statement**

For the Year Ended December 31, 20x5 (in \$ millions)

Sales	721.9
Operating expenses	<u>(417.0)</u>
Operating profit	304.9
Gain on sale of fixed assets	9.6
Depreciation	<u>(170.8)</u>
Earnings before interest and tax	143.7
Interest expense	<u>(40.3)</u>
Pre-tax income	103.4
Income taxes	<u>(31.0)</u>
Net income	72.4

Exhibit 2**Busicomb Inc. Balance Sheet****As of December 31 (in \$ millions)****20x5 20x4****Current Asset**

Cash and equivalents	31.2	14.0
Accounts receivable	72.0	64.8

Inventories	501.7	453.7
-------------	-------	-------

Total current assets	604.9	532.5
----------------------	-------	-------

Non-Current Assets

Property, plant, and equipment	1138.7	982.7
--------------------------------	--------	-------

Less: Accumulated depreciation	(370.0)	(216.0)
--------------------------------	---------	---------

Net property, plant, and equipment	<u>768.7</u>	<u>766.7</u>
------------------------------------	--------------	--------------

Total assets	1373.6	1299.2
--------------	--------	--------

Current Liabilities

Accounts payable	60.1	62.5
------------------	------	------

Notes payable	<u>30.0</u>	<u>20.0</u>
---------------	-------------	-------------

Total current liabilities	90.1	82.5
---------------------------	------	------

Non-Current Liabilities

Long term debt	<u>576.0</u>	<u>588.0</u>
----------------	--------------	--------------

Total liabilities	666.1	670.5
-------------------	-------	-------

Shareholders' Equity

Common equity	384.0	360.0
---------------	-------	-------

Retained earnings	<u>323.5</u>	<u>268.7</u>
-------------------	--------------	--------------

Total equity	<u>707.5</u>	<u>628.7</u>
Total liabilities and equity	1373.6	1299.2

Exhibit 3

Busicomb Inc. Cash Flow Statement

For the Year ended December 31, 20x5 (in \$ millions)

Cash Flow from Operating Activities

Net income	72.4
Depreciation	170.8
Gain on sale of fixed assets	(9.6)

Change in Working Capital

(Increase) Decrease in accounts receivable	(7.2)
(Increase) Decrease in inventories	(48.0)
Increase (Decrease) in accounts payable	(2.4)
Net change in working capital	(57.6)
Net cash from operating activities	176.0

Cash Flow from Investing Activities

Purchase of property, plant, and equipment	(183.2)
--	---------

Proceeds on disposal of plant and equipment	20.0
Net cash from investing activities	(163.2)
	12.8

Cash Flow from Financing Activities

Change in debt outstanding	(2.0)
Change in common stock	24.0
Payment of cash dividend	(17.6)
Net cash from financing activities	4.4
Net change in cash and cash equivalents	17.2
Cash at beginning of period	14.0
Cash at end of period	31.2

You can assume for the following question that the ROE of Busicomb Inc. is 12% and the cost of equity is 13% and the long-term sustainable rate of growth is 7.5%.

Binkster is concerned about the rate of growth he has assumed for the model and is aware that the residual income model can be used to calculate the implied rate of growth. He has compiled the following data for Entrebus Inc., a competitor, and wants to use this to calculate the implied rate of growth for Entrebus Inc.:

The price to book ratio 2.50

ROE 13%

Current book value per share \$8.00

Cost of equity 11%

Despite the issues encountered with post levered residual income Binkster is convinced that value based management approaches will prove beneficial in the analysis of Busicomb. His attention alights on another method referred to as Economic Value Added (EVA). Binkster makes the following estimates for Busicomb Inc. for 20x6:

EBIT \$150m

Tax rate 30%

Cost of equity 12%

Cost of debt 7%

The target debt to equity ratio for next year will be 1.

The invested capital is to be calculated as long-term debt plus stockholders' equity (using the information from the Exhibits 1–3).

Jon Binkster and a colleague, Bob Slacker, were discussing the merits of the residual income approach. Bob commented that the unrealized gains or losses relating to available for sale securities are reported in comprehensive income and not the income statement and that this results in earnings being an inaccurate measure of returns to investors. Bob states that the book value of equity is not affected.

Binkster commented that including the gains or losses from one-off asset sales in income would distort the estimation of future residual earnings and therefore these gains and losses should be excluded. However, there is no need to adjust the book value of equity.

Question #28 - 33 of 76

Question ID: 1473297

Calculate the total value of the common stock in Busicomb Inc. at 31 December 20x5 using the constant growth residual income valuation model. Work to the nearest \$m.

A) \$836m.

B) \$579m.

C) \$708m.

Question #29 - 33 of 76

Question ID: 1473298

Jon is comparing the different equity valuation models. He believes that the residual income model offers some advantages to the analyst over the other models. Which of the following is an advantage of the residual income model?

- A) It does not require the clean surplus relationship to hold.
 - B) The intrinsic value is not dominated by the terminal value.
 - C) No adjustments to the financial data is required.
-

Question #30 - 33 of 76

Question ID: 1473299

Use the information above and the residual income model to calculate the implied growth rate in Entrebus Inc.

- A) 13.33%.
 - B) 7.67%.
 - C) 9.67%.
-

Question #31 - 33 of 76

Question ID: 1473300

What is the *best* estimate of the EVA for Basicomb for 20x6?

- A) \$0.
 - B) -\$3.46m.
 - C) -\$5.84m.
-

Question #32 - 33 of 76

Question ID: 1473301

Bob's comment is *best* described as:

- A) correct.
 - B) incorrect as unrealized gains or losses are reported in the income statement.
 - C) incorrect as both the net income and book value of equity are incorrect stated.
-

Question #33 - 33 of 76

Question ID: 1473302

Binkster's comment is *best* described as:

- A) correct.
 - B) incorrect as gains or losses should not be adjusted.
 - C) incorrect as the book value of equity should be adjusted.
-

Question #34 of 76

Question ID: 1473240

A common adjustment in calculating economic value added (EVA[®]) is to:

- A) treat capital leases as operating leases.
 - B) add back deferred taxes.
 - C) capitalize and amortize research and development expenses.
-

Geremiah Analytics provides litigation consulting services to the intellectual property industry. They specialize in patent infringement liability and software valuation. Mariah Hofstedt, CFO of Geremiah, projects that the firm will earn \$3 million pre-tax income this year. Additional selected financial data on Geremiah are presented below.

Table 1: Selected Financial Data for Geremiah Analytics

Total assets	\$40 million
Debt/assets	60%
Average coupon on debt	8%

Cost of equity	12%
Tax rate	40%

Hofstedt has not been happy with the firm's financial performance. She would like to increase return on equity (ROE) and improve revenue growth, and is considering various ways to deploy Geremiah's cash flow in order to meet these two goals. One possibility is using some of Geremiah's cash flow to make a strategic acquisition.

Hofstedt has been looking at a smaller boutique firm, Logiciels LaMarre, which provides consulting services to the software industry. Hofstedt and a Geremiah Analytics valuation team have performed a preliminary valuation on Logiciels LaMarre using a free cash flow to equity (FCFE) model. However, Theodore LaMarre, CEO of Logiciels LaMarre, is not pleased with the resultant valuation that Geremiah has placed on his firm.

Rather than argue about the inputs of the free cash flow (FCF) model, LaMarre takes the position that FCFE is an inappropriate model for valuing Logiciels LaMarre. He cites the firm's rapid growth and resultant need for capital investment as reasons that valuing the firm on projections of FCFE is not reliable.

LaMarre wants Geremiah to value Logiciels LaMarre using the residual income approach.

LaMarre asserts, "The fact that our terminal value can be calculated with a high degree of certainty makes the use of a residual value model more appropriate than use of a FCFE model." Hofstedt counters that the residual income approach is not in LaMarre's interest. She points out, "Value tends to be recognized later in a residual income approach than in a FCFE approach."

There is, however, one point on which LaMarre and Hofstedt agree. They both recognize that competitive forces in the industry will drive the current high ROE of Logiciels LaMarre down to the cost of equity capital over time. Hofstedt concludes, "Given the assumption of a decline in ROE, we should use a persistence factor between zero and one." LaMarre disagrees, saying, "The assumption about ROE means that the present value of the continuing residual income at Logiciels LaMarre is the current residual income divided by the cost of equity capital."

Question #35 - 38 of 76

Question ID: 1473233

Regarding their statements about the forecast error in residual income models and when they recognize value, who is correct?

LaMarre

Hofstedt

- | | |
|--------------|-----------|
| A) Incorrect | Incorrect |
| B) Correct | Correct |
| C) Correct | Incorrect |
-

Question #36 - 38 of 76

Question ID: 1473234

Which of the following is *least likely* to characterize the difference between a residual income model and a FCFE model?

- A) Terminal value represents a higher proportion of intrinsic value in a residual income model than in a dividend discount model (DDM).
 - B) A residual income model is applicable to a firm that does not have FCF.
 - C) Inputs to a residual income model are more easily manipulated by management.
-

Question #37 - 38 of 76

Question ID: 1473235

The residual income of Geremiah Analytics is *closest* to:

- A) -\$120,000.
 - B) \$120,000.
 - C) \$1,080,000.00
-

Question #38 - 38 of 76

Question ID: 1473236

Regarding their statements about ROE and residual income, who is correct?

<u>LaMarre</u>	<u>Hofstedt</u>
----------------	-----------------

- | | |
|--------------|-----------|
| A) Correct | Incorrect |
| B) Incorrect | Correct |

C) Correct Correct

Question #39 of 76

Question ID: 1473239

Residual income is defined as:

- A) net income less a charge for capital investment.
 - B) operating income plus depreciation and amortization.
 - C) net income less a charge that measures stockholders' opportunity cost in generating that income.
-

Question #40 of 76

Question ID: 1473280

An argument for using the residual income (RI) valuation approach is that:

- A) the models focus on economic rather than just on accounting profitability.
 - B) the clean surplus relation fails to hold.
 - C) the models rely on accounting data that can be manipulated by management.
-

Question #41 of 76

Question ID: 1473245

A residual income model would be *least appropriate* as a tool to measure which of the following?

- A) Goodwill impairment.
 - B) Operating leverage.
 - C) Economic income.
-

Question #42 of 76

Question ID: 1473266

Advanced Instruments reported the following for the end of its fiscal year:

- Revenues = \$50.3 million.
- Earnings per share = \$0.68.
- Dividends per share = \$0.17.
- Shares outstanding = 5 million.
- Tax rate = 40%.

Book value per share was \$4 at the beginning of the year. If the required rate of return is 15%, what is the value of the shares using a single-stage residual income model?

- A)** \$6.01.
 - B)** \$4.78.
 - C)** \$7.56.
-

Question #43 of 76

Question ID: 1473246

The residual income approach is appropriate when:

- A)** the clean surplus accounting relation is violated significantly.
 - B)** a firm pays high dividends that are quite stable.
 - C)** a firm does not pay dividends or the payments are too volatile to be sufficiently predictable.
-

Question #44 of 76

Question ID: 1473238

Travel Advisors has earnings before interest and taxes (EBIT) of \$200 million, interest expense of \$83 million, taxes of \$46.8 million, and total debt of \$125 million. It is also financed with total equity of \$650 million, which has a required rate of return of 12 percent. What is Travel Advisors' residual income? A:

- A)** loss of \$70.2 million.
 - B)** profit of \$70.2 million.
 - C)** loss of \$7.8 million.
-

Question #45 of 76

Question ID: 1473290

In general, firms making aggressive accounting decisions will report *future* earnings that are:

- A)** lower.
 - B)** inflation-adjusted.
 - C)** higher.
-

Question #46 of 76

Question ID: 1473243

SmallCo has the following characteristics:

- Long-term debt = \$55 million
- Equity = \$45 million
- WACC = 11%
- EBIT = \$10 million
- Marginal tax rate = 30%

SmallCo's economic value added is *closest* to:

- A)** +\$1 million.
 - B)** -\$1 million.
 - C)** -\$4 million.
-

Question #47 of 76

Question ID: 1473257

Assuming that the growth rate is less than the required rate of return (r), a decrease in initial book value will cause value in a residual income (RI) model to:

- A)** decrease.
 - B)** there is insufficient information to determine the effect on RI.
 - C)** increase.
-

Question #48 of 76

Question ID: 1473255

In a single-stage residual income model for a firm with return on equity (ROE) greater than the required rate of return, which statement is *least* accurate?

- A) The justified price-to-book value (P/B) ratio will be greater than one.
 - B) Market value will be greater than book value.
 - C) Free cash flow to equity will be positive.
-

Question #49 of 76

Question ID: 1473282

Which description of the relationship among residual income, dividend discount (DDM) and free cash flow to equity (FCFE) models is *least* accurate?

- A) Residual income differs from DDM and FCFE in that residual income starts with book value.
 - B) Residual income differs from DDM and FCFE in that it discounts income rather than cash.
 - C) The different models should result in different intrinsic values because of the theoretical differences in the models.
-

Question #50 of 76

Question ID: 1473254

Professor Cliff Webley made the following statements in his asset-valuation class:

- | | |
|--------------|--|
| Statement 1: | "Residual income approaches generally model ROE as approaching zero over time." |
| Statement 2: | "If actual return on equity equals required return on equity, the residual income model sets the company's proper market value equal to its book value." |
| Statement 3: | "Using consistent assumptions, the single-stage residual income model should give you the same valuation as the Gordon Growth Dividend-discount model." |

Which of Webley's statements is *least* accurate?

- A) Statement 1.
 - B) Statement 2.
 - C) Statement 3.
-

Question #51 of 76

Question ID: 1473287

The residual income approach is NOT appropriate when:

- A) a firm does not pay dividends or the stream of payments is too volatile to be sufficiently predictable.
 - B) expected free cash flows are negative for the foreseeable future.
 - C) the clean surplus accounting relation is violated significantly.
-

Question #52 of 76

Question ID: 1473272

A common assumption regarding continuing residual income (RI) is that RI:

- A) declines to zero as return on equity (ROE) drops to the cost of equity over time.
 - B) falls to the average industry level.
 - C) manifests a generally increasing trend indefinitely.
-

Question #53 of 76

Question ID: 1473303

Reported accounting data are *most likely* to bias an estimate of residual income when:

- A) standards allow charges directly to stockholders' equity while bypassing the income statement.
 - B) standards allow charges directly to stockholders' equity that are also reflected on the income statement.
 - C) the clean surplus relation holds.
-

Ilias Chair has read a recent article on the internet which championed the benefits of using a residual income model to calculate company valuations. He is having trouble understanding the model, and has presented you with the following assumptions for a hypothetical company that the article used, and would like to know the valuation it results in.

RI Inc.

Return on equity	4.6%
Retention rate	0.6
Current book value per share	\$8.50

Required rate of return for equity holders 4%

Chair currently uses dividend valuation methodology to compute intrinsic value. He is interested to know if residual income models could be adapted and used instead of the dividend discount model (DDM). Chair has two main concerns about using it instead of the DDM:

Concern 1: The residual income model seems to be to some extent dependent on book value per share, which may be calculated differently according to the accounting policy choices a firm makes.

Concern 2: It's a shame that all residual income models assume constant growth in economic profit. It seems unreasonable to assume that economic profits can be sustained let alone grow at a constant rate. The models don't seem to factor in the impact of competition on future residual income.

Ilias is also trying to assess a fundamental value of yet another company in the sector, Topper Inc., using the residual income model. He believes that the current value of Topper is primarily based on the current book value plus the present value of residual income for the next three years.

Ilias estimates the required return to equity holders to be 4% pa. The current book value per share is \$8.50.

He has estimated the EPS forecasts for the next three years to be \$1.50, \$1.40, and \$1.35 respectively. Her estimates for the dividend per share for the next three years are \$0.70, \$0.75, and \$0.80 respectively.

Chair does have concerns about the use of a residual income model for Topper.

Ilias has extracted the following from the Accounting Policies Note in Topper's most recent annual report:

Foreign Subsidiaries:

Topper Inc. has two foreign subsidiaries which are both based in Europe and for the purposes of the group accounts, Topper has assumed that the Euro is the functional currency for both, and hence, used the current rate method for translation into the group reporting currency (U.S. dollars).

Financial Instruments:

Topper Inc. owns \$3 million of par value bonds issued by Pastini Inc., which are due to mature in 2x18. The group intends to hold the bonds until 2x18 and hence they have been classed as amortized cost on the Group Balance Sheet.

Question #54 - 57 of 76

Question ID: 1473292

Using the assumptions given for RI Inc., and using a single stage (constant growth) model the hypothetical company shares would be valued at:

- A) \$12.61.
 - B) \$9.78.
 - C) \$10.86.
-

Question #55 - 57 of 76

Question ID: 1473293

Is Chair correct in his stated concerns?

- A) Incorrect in both.
 - B) Correct in Statement 1 only.
 - C) Correct in Statement 2 only.
-

Question #56 - 57 of 76

Question ID: 1543899

Using Chair's estimates and assumptions, what would the value per share of Topper be estimated at, using the residual income model:

- A)** \$9.23.
 - B)** \$10.20.
 - C)** \$11.41.
-

Question #57 - 57 of 76

Question ID: 1473295

Which of the accounting policy note extracts identified by Chair would cause an issue with the "clean surplus relationship" when using the residual income model for Topper Inc.?

- A)** Foreign Subsidiaries note.
 - B)** Financial Instruments note.
 - C)** Both the Foreign Subsidiaries and the Financial Instruments note.
-

Question #58 of 76

Question ID: 1473271

An analyst is considering the purchase of Delphos Machinery, which has a price-to-book value (P/B) ratio of 8.00. Return on equity (ROE) is expected to be 14%, current book value per share is \$12.00, and the cost of equity is 11%. What growth rate is implied by the current P/B rate?

- A)** 8.43%.
 - B)** 10.57%.
 - C)** 11.00%.
-

Question #59 of 76

Question ID: 1473241

Market value added is calculated as:

- A)** net operating profit after taxes minus a charge for total capital.
- B)** market value of the company minus a charge for equity capital.

C) market value of the company minus total capital.

Question #60 of 76

Question ID: 1473256

Among the various price multiples, the residual income model is *most closely* linked to which of the following?

- A) Price to book value (P/B).
 - B) Price to free cash flow (P/FCF).
 - C) Price to earnings (P/E).
-

Question #61 of 76

Question ID: 1473286

Which of the following characteristics of a company would make it unsuitable for residual income valuation analysis?

- A) Book-value estimates are not reliable.
 - B) The forecast of terminal value is not reliable.
 - C) Free cash flows are negative and likely to remain so for some time.
-

Question #62 of 76

Question ID: 1473250

Red Shoes's recent financial statements reported a book value of \$11.00 per share; its required rate of return is 9%. Analyst Tony Giancola, CFA, wants to calculate the company's intrinsic value using a multistage residual income with a high-growth RI for the next 5 years. Giancola creates the following estimates:

- PV of interim high-growth RI for the next 5 years is \$ 2.90
- At the end of year 5, the PV of continuing RI is \$7.00
- Estimated Book Value in 5 years is \$14.00

Which of the following is *closest to* the current intrinsic value of Red Shoes?

- A) \$9.90.

B) \$18.45.

C) \$20.90.

Question #63 of 76

Question ID: 1473285

An argument against using the residual income (RI) valuation approach is that:

A) the models focus on economic rather than just on accounting profitability.

B) the models rely on accounting data that can be manipulated by management.

C) terminal value does not dominate total present value as is the case in dividend and free cash flow valuation models.

Question #64 of 76

Question ID: 1473247

Which of the following is the *most* appropriate tool to measure managerial effectiveness, goodwill impairment, and equity value?

A) Residual income.

B) Free cash flow to the firm.

C) Gordon growth model.

Question #65 of 76

Question ID: 1473248

Creative Gardening is expected to have a return on equity (ROE) of 13% for the next five years and slightly lower thereafter. Its current book value per share as of the *beginning* of year 1 (i.e., the end of year 0) is \$7.50 per share and its required rate of return is 10%. The premium over book value at the end of five years is expected to be 30%. All earnings are reinvested. The sum of the present values of the residual income estimates over the next five years is \$1.10. The projected ending book value in year 5 is \$13.83. What is the value of Creative Gardening using these inputs?

A) \$11.18.

B) \$13.83.

C) \$8.60.

Question #66 of 76

Question ID: 1473278

Which statement *best* describes the relationship between the residual income model and the free cash flow to equity model?

- A) They do not rely on accounting assumptions.
 - B) They both discount a future stream of cash flows.
 - C) Intrinsic value calculated by both should be the same if the assumptions are the same.
-

Sue Clifton, CFA, is a senior portfolio manager at Lewiston Investments, a small research firm. Clifton has been assigned to help new hire Ralph Rawls get acclimated to his new job as a stock analyst. She discovers early on that Rawls is not too familiar with residual income valuation, a tool for determining economic profitability.

Clifton explains the basics of the residual-income model and the clean surplus relationship that underpins the system.

Clifton explains to Rawls that analysts use assumptions to make the residual-income models easier to interpret. She goes on to identify four commonly used assumptions: Residual income can be expected to:

- disappear immediately
- decline gradually as return on equity (ROE) declines
- stay at the same level indefinitely
- decline to the market average

After her initial review of residual income, Clifton gives Rawls a test. The answers depend on the use of the following information about CR Industries in Year X (in \$ millions):

Invested capital	\$225
Market capitalization	\$231
Debt	\$130
Sales	\$90

Cost of goods sold (COGS)	\$26
Selling, general & administrative (SG&A) expense	\$10
Depreciation and amortization expense	\$25
Interest expense	\$6.5
Dividend expense	\$6
Tax rate	40.0%
Pretax cost of equity	11.4%
Pretax cost of debt	5.00%

Question #67 - 70 of 76

Question ID: 1473228

When a company's ROE is the same as the return required by the market, the stock's justified market value is *closest* to the:

- A)** book value plus residual income.
 - B)** actual market value plus residual income.
 - C)** book value.
-

Question #68 - 70 of 76

Question ID: 1473229

Which of the following assumptions is not commonly used to simplify the calculation of residual income? Continuing residual income is expected to:

- A)** disappear immediately.
 - B)** decline to the market average.
 - C)** decline gradually as ROE declines.
-

Question #69 - 70 of 76

Question ID: 1473230

Which of the following scenarios represents a violation of the clean surplus relationship?

- A) A company stops paying dividends suddenly.
 - B) Unusual charges against income.
 - C) The market value of securities available for sale changes.
-

Question #70 - 70 of 76

Question ID: 1473231

The economic value added (EVA) of CR Industries is *closest* to:

- A) -\$4.53 million.
 - B) -\$8.13 million.
 - C) \$2.67 million.
-

Question #71 of 76

Question ID: 1473283

Which of the following statements *least* accurately explains the relationship between the residual income (RI) model, the dividend discount model (DDM), and free cash flow to equity (FCFE):

- A) RI models use an equity value from the balance sheet plus the present value of expected future residual income.
 - B) FCFE models use historical cash flows.
 - C) All the models discount future cash flows or income at the required rate of return.
-

Question #72 of 76

Question ID: 1473276

If a multistage residual income model incorporates a persistence factor of zero, the analyst is *most likely* assuming that residual income will:

- A) persist at the current level forever.
 - B) fall to zero immediately.
 - C) decline to zero over time.
-

Question #73 of 76

Question ID: 1473244

Travel Advisors has earnings before interest and taxes (EBIT) of \$200 million, interest expense of \$83 million, taxes of \$46.8 million, and total debt of \$125 million. It is also financed with total equity of \$850 million, which has a required rate of return of 12%. What is Travel Advisors' residual income?

- A)** A loss of \$31.8 million.
 - B)** A profit of \$31.8 million.
 - C)** A profit of \$70.2 million.
-

Question #74 of 76

Question ID: 1473252

The single-stage residual income model values a company at:

- A)** book value plus the terminal value discounted at the weighted average cost of capital.
 - B)** book value plus the present value of the firm's expected economic profits.
 - C)** book value times a factor determined by the discount rate.
-

Question #75 of 76

Question ID: 1473274

Continuing residual income is defined as the:

- A)** residual income that is expected beyond the initial forecast time horizon.
 - B)** residual income that forces the net present value to zero.
 - C)** permanent as opposed to the transitory part of residual income.
-

Question #76 of 76

Question ID: 1473270

An investor is considering the purchase of Microscopics, which has a price to book value (P/B) ratio of 4.00. Return on equity (ROE) is expected to be 12%, current book value per share is \$12.00, and the cost of equity is 10%. What growth rate is implied by the current P/B rate?

- A)** 0.67%.
- B)** 10.00%.
- C)** 9.33%.
