

Question #1 of 71

Question ID: 1473406

Assume that the interest rates in the future are not expected to differ from current spot rates. In such a case, the liquidity premium theory of the term structure of interest rates projects that the shape of the yield curve will be:

- A)** variable.
 - B)** upward sloping.
 - C)** downward sloping.
-

Question #2 of 71

Question ID: 1473368

Jorgen Welsher, CFA obtains the following quotes for zero coupon government bonds all with a par value of \$100.

Type of Price	Delivery (years)	Maturity (years)	Price
Spot	0	3	\$91.51
Forward	2	3	\$94.55
Spot	0	2	\$92.45

Welsher can earn arbitrage profits by:

- A)** buying the 2-year bond in the spot market, going long the forward contract and selling the 3-year bond in the spot market.
 - B)** buying the 2-year bond in the spot market, going short the forward contract and selling the 3-year bond in the spot market.
 - C)** selling the 2-year bond in the spot market, going short the forward contract and buying the 3-year bond in the spot market.
-

Question #3 of 71

Question ID: 1473420

Volatility in short-term rates is *most likely* related to uncertainty about:

- A) monetary policy.
- B) inflation.
- C) the real economy.

Holly Jameson, CFA, has recently started a new role as a bond analyst at her employer, Holt Investment Management, LLC, based in Farland. Her team leader has provided her with up-to-date but incomplete data on the benchmark term structure of interest rates, shown in Exhibit 1.

Exhibit 1: Farland Treasury Bond Rates

Maturity (years)	Spot	Forward	Par
1	2.30%	-	2.30%
2			3.14%
3			4.35%

Holly is evaluating a three-year, 6% annual coupon, benchmark bond trading at \$108.30.

In a discussion in the staff dining room shortly after she joined the firm, Holly's colleague, Doug Ross, made a confident assertion:

"I really don't know how some people find bond trading difficult. For each specific maturity, spot rates are always lower than forward rates, and forward rates are always lower than corresponding yield-to-maturity. So you can always achieve a higher return investing in shorter maturity bonds by rolling down the yield curve. I've been doing that since my first day on the job."

Holt offers both domestic and international bonds to its clients to enable them to benefit from risk reduction through diversification. She has carried out some preliminary research on the Happyland bond market and has found that the yield curve has an unexpected shape and does not seem to be driven by interest rate expectations. She asks her team leader, Al Smith, for advice, who tells her:

"Things are strange in Happyland. Rates are influenced simply by supply and demand of bonds of specific maturities. Different types of investors want particular maturity bonds, and

they never seem to deviate from their preferences. High demand for five-year bonds has pushed prices up and yields down."

Alex Allan, a bond analyst colleague of Holly, started another discussion with the group by stating:

"I'm more interested in what happens to bond prices when the yield curve changes. I need to estimate how much prices will change when short-term yields increase while long-term yields stay constant."

Question #4 - 7 of 71

Question ID: 1473426

The benchmark bond being assessed by Holly is *most* likely:

- A) undervalued by \$3.69.
 - B) overvalued by \$2.90.
 - C) overvalued by \$3.75.
-

Question #5 - 7 of 71

Question ID: 1473427

The comment made by Ross is *most* likely:

- A) inaccurate with respect to the statement about spot rates, forward rates, and yields.
 - B) inaccurate with respect to the statement about rolling down the yield curve.
 - C) inaccurate in both respects.
-

Question #6 - 7 of 71

Question ID: 1473428

Smith's comments about interest rates in Happyland *most* likely supports which theory of the term structure of interest rates?

- A) Liquidity preference theory.
 - B) Segmented markets theory.
 - C) Local expectations theory.
-

Question #7 - 7 of 71

Question ID: 1473429

The *most* appropriate measure for Alex Allan to assess bond price sensitivity is:

- A)** key rate duration.
 - B)** effective duration.
 - C)** Macaulay duration.
-

Question #8 of 71

Question ID: 1473422

Rising inflation when the economy is expanding could *most likely* lead to a:

- A)** bullish steepening.
 - B)** bearish flattening.
 - C)** bearish steepening.
-

Question #9 of 71

Question ID: 1473370

The following are some of the current par rates:

Year	Par rate
1	5.00%
2	6.00%
3	7.00%

Using bootstrapping, the 3-year spot rate is *closest* to:

- A)** 6.93%
 - B)** 6.67%
 - C)** 7.09%
-

Question #10 of 71

Question ID: 1473403

Jim Malone, CIO of Sigma bond fund had a successful track record of investing in investment grade bonds. Recently though, Sigma has been lagging its peers because Malone refuses to reduce the duration of the portfolio by purchasing short-term bonds for the fund. Malone's actions are *most consistent* with:

- A) Segmented markets theory.
 - B) Liquidity preference theory.
 - C) Preferred habitat theory.
-

Question #11 of 71

Question ID: 1473408

During the recent credit crises in the country of Maltovia, several money market funds reported large losses. Subsequently, the Maltovian regulatory body imposed strict restrictions on maturity of securities that money market funds could invest in. The reaction of Maltovian regulatory body was *most likely* based on a belief in:

- A) preferred habitat theory
 - B) market segmentation theory.
 - C) local expectations theory.
-

Question #12 of 71

Question ID: 1473386

The swap spread will increase with:

- A) the variability of interest rates.
 - B) a deterioration in one party's credit.
 - C) an increase in the credit spread embedded in the reference.
-

Question #13 of 71

Question ID: 1473381

Compared to a yield curve based on government bonds, swap rate curves are:

- A) less comparable across countries and have a greater number of yields at various maturities.
 - B) more comparable across countries and have a smaller number of yields at various maturities.
 - C) more comparable across countries and have a greater number of yields at various maturities.
-

Question #14 of 71

Question ID: 1473423

To jump start a sluggish economy could *most likely* lead to a:

- A) bearish steepening.
 - B) bullish steepening.
 - C) bearish flattening.
-

Question #15 of 71

Question ID: 1473398

According to the liquidity theory, how are forward rates interpreted? Forward rates are:

- A) equal to futures rates.
 - B) expected future spot rates.
 - C) expected future spot rate plus a rate exposure premium.
-

Question #16 of 71

Question ID: 1473419

Volatility in long-term rates is *most likely* related to uncertainty about:

- A) central bank actions.
 - B) the real economy and inflation.
 - C) fiscal policy.
-

Question #17 of 71

Question ID: 1473414

What adjustment must be made to the key rate durations to measure the risk of a steepening of an already upward sloping yield curve?

- A)** Decrease the key rates at the short end of the yield curve.
 - B)** Increase all key rates by the same amount.
 - C)** Increase the key rates at the short end of the yield curve.
-

Question #18 of 71

Question ID: 1473376

Which one of the following actions is *most consistent* with the strategy of riding an upward sloping the yield curve? Buying bonds with a maturity:

- A)** equal to the investor's horizon.
 - B)** shorter than the investor's horizon.
 - C)** longer than the investor's horizon.
-

Question #19 of 71

Question ID: 1473415

Which of the following *best* describes key rate duration? Key rate duration is determined by:

- A)** changing the curvature of the entire yield curve.
 - B)** changing the yield of a specific maturity.
 - C)** shifting the whole yield curve in a parallel manner.
-

Question #20 of 71

Question ID: 1473401

Which theory explains the shape of the yield curve by considering the relative demands for various maturities?

- A)** The segmentation theory.
- B)** The liquidity premium theory.

C) The pure expectations theory.

Question #21 of 71

Question ID: 1473407

A portfolio manager who believed in the liquidity premium theory would expect:

- A) short-term rates to be lower than investors' expectations of short-term rates, because of the liquidity premium.
 - B) long-term rates to be higher than investors' expectations of future rates, because of the liquidity premium.
 - C) long-term securities to offer higher returns than short-term securities.
-

Question #22 of 71

Question ID: 1473421

Which of the following statements are *most accurate*?

- A) Volatility of short-term and long-term rates is typically equal.
 - B) Long-term rates are typically more volatile than short-term rates.
 - C) Short-term rates are typically more volatile than long-term rates.
-

Question #23 of 71

Question ID: 1473394

Assuming the pure expectations theory is correct, an upward sloping yield curve implies:

- A) interest rates are expected to increase in the future.
 - B) longer-term bonds are riskier than short-term bonds.
 - C) interest rates are expected to decline in the future.
-

Question #24 of 71

Question ID: 1473379

Joe McBath makes the following two statements:

Statement 1: The swap rate curve indicates credit spread over government bond yield.

Statement 2: The swap rate curve indicates the premium for time value of money at different maturities.

Joseph is *most likely* correct with regard to:

- A) Statement 2 but not statement 1.
 - B) Both statements.
 - C) Statement 1 but not statement 2.
-

Question #25 of 71

Question ID: 1473402

According to the pure expectations theory, how are forward rates interpreted? Forward rates are:

- A) equal to futures rates.
 - B) expected future spot rates.
 - C) expected future spot rates if the risk premium is equal to zero.
-

Question #26 of 71

Question ID: 1473377

Independence Bank is a small retail bank that specializes in demand deposits and invests in CMO tranches. For the purpose of valuation of Independence Bank's assets and liabilities, the *most appropriate* reference yield curve would be:

- A) MRR-OIS curve.
 - B) swap rate curve.
 - C) government spot curve.
-

Question #27 of 71

Question ID: 1484387

Prices of zero-coupon, \$1 par bonds is shown below:

Maturity (years)	Price
1	\$0.9615
2	\$0.9070
3	\$0.8396
4	\$0.7629

The default risk of these bonds is similar to the default risk of surveyed banks based on which the swap rate is determined.

Government yield curve is given below:

Maturity (years)	Rate
1	3.05%
2	4.10%
3	5.25%
4	6.45%

The three-year swap spread is closest to:

- A) 67 bps.
 - B) 110 bps.
 - C) 78 bps.
-

Question #28 of 71

Question ID: 1473366

The price of a five-year zero coupon bond is \$0.7835 for \$1 par and the price of a two-year zero-coupon bond is \$0.9426 for \$1 par. The three-year forward rate two years from now is *closest* to:

- A) 5.54%
 - B) 4.87%
 - C) 6.36%
-

Question #29 of 71

Question ID: 1473390

A 2-year \$1,000 par, 5% (semi-annual pay) Mexa-corp bond has a Z-spread of 45bps. Using the following spot curve, compute the invoice price of the bond.

Maturity	0.50	1.00	1.50	2.00
Spot rates	4.50%	5%	5.25%	5.5%

- A) \$956.32
 - B) \$982.65
 - C) \$993.45
-

Question #30 of 71

Question ID: 1473361

Given annual spot interest rates for 1 year, 2 years, 3 years, 4 years, and 5 years, the maximum number of forward rates that can be derived is *closest* to:

- A) 10
 - B) 8
 - C) 5
-

Question #31 of 71

Question ID: 1473383

Government spot rate curve is given below:

Maturity (years)	Rate
1	3.05%
2	4.10%
3	5.25%
4	6.45%

The swap fixed rate for a period of 2 years is *closest* to:

- A) 4.08%

B) 4.75%

C) 4.98%

Question #32 of 71

Question ID: 1473363

If the spot curve is upward sloping, the forward curve is *most likely* to be:

A) parallel to the spot curve and below the spot curve.

B) steeper than the spot curve and above the spot curve.

C) parallel to the spot curve and above the spot curve.

Question #33 of 71

Question ID: 1473367

Use the following spot rate curve to answer this question:

Maturity	1	2	3
Spot rates	5%	5.5%	6%

The price of a 1-year \$1 par, zero-coupon bond to be issued in two years is *closest* to:

A) \$0.8396

B) \$0.9434

C) \$0.9345

Martha Garret, CFA, manages fixed-income portfolios for Jones Brothers, Inc. (JBI). JBI has been in the portfolio management business for over 23 years and provides investors with access to actively managed equity and fixed-income portfolios. All of JBI's fixed-income portfolios are constructed using U.S. debt instruments. Garret's primary portfolio responsibilities are the Quasar Fund and the Nova Fund, both of which are long fixed-income portfolios consisting of Treasury securities in all maturity ranges. The Quasar Fund holdings as of March 15 are provided in Exhibit 1. A comparison of key rate durations for the Quasar Fund and Nova Fund is provided in Exhibit 2.

Exhibit 1: Quasar Fund

Bond	Maturity (years)	Coupon	Yield	Par Value	Market Value	Duration
A	2	5.0%	5.0%	4,000,000	4,000,000	1.86
B	5	4.5%	6.0%	3,500,000	3,278,851	4.32
C	15	8.0%	7.0%	2,750,000	3,000,468	8.90
D	30	6.5%	4.0%	6,450,000	9,238,340	15.90

Exhibit 2: Key Rate Durations for Quasar Fund & Nova Fund

Fund	Maturity (years)			
	2	5	15	30
Quasar Fund	0.90	1.20	1.80	6.10
Nova Fund	0.40	2.50	3.40	1.10

Of particular importance to Garret and her colleagues is the degree of interest rate risk exposure unique to each portfolio under JBI's management. Driving the increased awareness of the portfolios' interest rate exposure is the double-digit growth in assets under management that JBI's fixed-income portfolios have experienced in the past five years. Interest in the company's fixed income portfolios continues to grow and as a result, all portfolio managers are required to attend weekly meetings to discuss key portfolio risk factors. At the last meeting, Miranda Walsh, a principal at JBI, made the following comments:

"The variance of daily interest rate changes has been trending higher over the past three months, leading us to believe that a period of high volatility is approaching in the next 12 to 18 months. However, the reliability is questionable because the volatility estimates were derived using an option pricing model, which assumes constant interest rates."

"Also, the Treasury spot rate curve currently has a similar shape to the yield curve on Treasury coupon securities, which according to the market segmentation theory of interest rate term structure, indicates a relatively high level of demand from investors for intermediate term securities. Overzealous trading by investors unwilling to move into other maturity ranges may create mispricing and opportunities for arbitrage."

After the meeting, Walsh and JBI's other principals met to discuss a new international portfolio opportunity. At Walsh's suggestion, the principals selected Garret as the lead portfolio manager for the new fund, which will be titled the Atlantic Fund. One of the other portfolio managers, Greg Terry, CFA, suggested to Garret that she utilize the MRR swap

curve as a benchmark for the Atlantic fund rather than using local government yield curves. Terry justifies his suggestion by claiming that "the lack of government regulation in the swap market makes swap rates and curves directly comparable between different countries despite fewer maturity points with which to construct the curve as compared to a government yield curve. Furthermore, credit risk in the swap curves of various countries is similar, thus avoiding the complications associated with different levels of sovereign risk embedded in government yield curves." Intrigued by the idea of using the swap curve, Garret has her assistant begin gathering a range of current and forward MRR rates.

Question #34 - 35 of 71

Question ID: 1473411

Evaluate Walsh's comments regarding the method used to estimate the expected increase in interest rate volatility and the term structure of interest rates.

- A)** Walsh is incorrect with respect to both interest rate volatility and term structure.
 - B)** Walsh is correct only with respect to interest rate volatility.
 - C)** Walsh is correct with respect to both interest rate volatility and term structure.
-

Question #35 - 35 of 71

Question ID: 1473412

Which of the following *best* evaluates Terry's justification for using the swap curve as the benchmark for the Atlantic Fund? Terry's justification is:

- A)** correct.
 - B)** incorrect because there are different levels of credit risk in the swap curves of different countries.
 - C)** incorrect because there are actually more maturity points to construct the swap curve.
-

Lihua Zhou has recently been hired by Ragun Asset Management, and is currently working for the fixed income team. Zhou receives a communication from Cindy Roll, chief economist, and makes the following notes:

Forecast U.S. Federal Reserve is increasingly concerned with rising inflation and expected
1: to tighten monetary policy during the next meeting.

Forecast The EU zone is expected to see a bullish flattening of the yield curve.

2:

Zhou notices that the firm's portfolio in the EU zone is almost exclusively medium remaining maturity (10-11 years) notes.

Zhou attends an informal discussion group with colleagues who have also recently joined the firm. During their discussion, Amanda Eden, one of Ragun's risk analysts, made two comments:

Comment "There are lots of bond spreads, each with different bases. For instance, the

1: spread I'm tracking at the moment measures the difference between the return on Treasury bills and the interest rate used to price the Eurodollar futures contracts."

Comment "If the spread widens, it's an indicator that risk in the banking system is

2: increasing."

Question #36 - 39 of 71

Question ID: 1473431

Based on Forecast 1, what is the *most* appropriate expected change in the shape of the yield curve?

- A)** A bullish steepening.
 - B)** A bearish steepening.
 - C)** A bearish flattening.
-

Question #37 - 39 of 71

Question ID: 1473432

What would be the *most* appropriate duration-neutral strategy based on information presented in Forecast 2?

- A)** Rotate into a barbell strategy.
 - B)** Rotate into a long-maturity bullet portfolio.
 - C)** Rotate into a short-maturity bullet portfolio.
-

Question #38 - 39 of 71

Question ID: 1473433

Based on her first comment about bond spreads, Eden is *most* likely tracking which spread?

- A) TED spread.
 - B) MRR-OIS spread.
 - C) Z-spread.
-

Question #39 - 39 of 71

Question ID: 1473434

Eden's second comment about bond spreads is *most* likely:

- A) correct.
 - B) incorrect, because a narrowing spread indicates a reduction in risk in the banking system.
 - C) incorrect, because the spread does not give a specific indication about risk in the banking system.
-

Question #40 of 71

Question ID: 1473387

7.5%, 15-year, annual pay option-free Xeleon Corp bond trades at a market price of \$95.72 per \$100 par. The government spot rate curve is flat at 5%.

The Z-spread on Xeleon Corp bond is *closest* to:

- A) 300 bps
 - B) 250 bps
 - C) 325 bps
-

Question #41 of 71

Question ID: 1473372

Jon Smithson is a bond trader at Zezen Bank. The spot rate curve is currently flat. Smithson expects that the curve will become upward sloping in the next year. Based on this expectation, the *least appropriate* active strategy for Smithson would be to:

- A)** sell all the long-term bonds in the portfolio and reinvest the proceeds in shorter-maturity bonds.
 - B)** reduce the duration of the portfolio.
 - C)** increase the duration of the portfolio.
-

Question #42 of 71

Question ID: 1473395

If the liquidity preference hypothesis is true, what shape should the term structure curve have in a period where interest rates are expected to be constant?

- A)** Flat.
 - B)** Downward sloping.
 - C)** Upward sloping.
-

Question #43 of 71

Question ID: 1473380

Which of the following is NOT a reason why market participants prefer the swap rate curve over a government bond yield curve? The swap market:

- A)** is free of government regulation.
 - B)** it is not affected by technical factors.
 - C)** reflects sovereign credit risk.
-

Question #44 of 71

Question ID: 1473409

With respect to local expectations theory, which of the following statements is *most consistent* with market evidence?

- A) Short-term holding period return of long-maturity bonds and the short-term holding period return of short-maturity bonds is the same.
 - B) Short-term holding period return of long-maturity bonds exceeds the short-term holding period returns of short-maturity bonds.
 - C) Short-term holding period return of short-maturity bonds exceeds the short-term holding period returns of long-maturity bonds.
-

Question #45 of 71

Question ID: 1473374

If an active bond portfolio manager believes future spot rates will be lower than indicated by today's forward rates, then she will *most likely*:

- A) be indifferent because her holding period return will be unaffected.
 - B) purchase bonds because the market is discounting future cash flows at "too high" of a discount rate.
 - C) sell bonds because the market appears to be discounting future cash flows at "too high" of a discount rate.
-

Question #46 of 71

Question ID: 1473413

The *least* important factor explaining the changes in the shape of the yield curve is:

- A) Curvature
 - B) Level
 - C) Steepness
-

Question #47 of 71

Question ID: 1473365

Use the following spot rate curve to answer this question:

Maturity	1	2	3
Spot rates	5%	5.5%	6%

The 1-year forward rate in one year [$f(1,1)$] and the 1-year forward rate in two years [$f(2,1)$] is *closest* to:

$f(1,1)$ $f(2,1)$

- A)** 4% 4.89%
- B)** 5.25% 5.75%
- C)** 6% 7%
-

Question #48 of 71

Question ID: 1473418

A bond portfolio has the following key rate durations:

$$D_2 = 0.50; D_5 = 2.70 \text{ and } D_{15} = 7.23.$$

Suppose that the change in yield curve results in changes in the following par rates:

$$p_1 = +50\text{bps}; p_2 = +100\text{bps}; p_5 = +25 \text{ bps}; p_{10} = -75\text{bps}; p_{15} = -100\text{bps}.$$

The change in the value of the portfolio will be *closest* to:

- A)** 4.75%
- B)** 6.06%
- C)** -2.80%
-

Question #49 of 71

Question ID: 1473417

An analyst has a list of key rate durations for a portfolio of bonds. If only one interest rate on the yield curve changes, the effect on the value of the bond portfolio will be the change of that rate multiplied by the:

- A) weighted average of the key rate durations.
 - B) key rate duration associated with the maturity of the rate that changed.
 - C) median of the key rate durations.
-

Question #50 of 71

Question ID: 1473373

It is now January 1, 20x7. The one-year spot rate now is exactly equal to the one-year forward rate for a loan in one year as of January 1, 20x6. The current forward price of \$1 par, zero-coupon bond for delivery on January 1, 20x8 will *most likely* be:

- A) lower than it was on January 1, 20x6.
 - B) higher than it was on January 1, 20x6.
 - C) the same as it was on January 1, 20x6.
-

Question #51 of 71

Question ID: 1473424

Investors may rotating money out of risky investments and into relatively safe investments during a financial crisis would *most likely* lead to which of the following?

- A) Bearish flattening.
 - B) Bearish steepening.
 - C) Bullish flattening.
-

Question #52 of 71

Question ID: 1473393

Under the liquidity preference theory, expected future spot rates will *most likely* be:

- A) Equal to the current forward rate.
 - B) More than the current forward rate.
 - C) Less than the current forward rate.
-

Question #53 of 71

Question ID: 1473371

An active bond portfolio manager would *most* appropriately buy bonds when expected spot rates are:

- A) less than current forward rates.
 - B) equal to current forward rates.
 - C) greater than current forward rates.
-

Question #54 of 71

Question ID: 1473392

Credit risk in the banking system is most accurately captured by the:

- A) TED spread.
 - B) 10-year swap spread.
 - C) I-spread.
-

Question #55 of 71

Question ID: 1473400

Don McGuire, fixed income specialist at MCB bank makes the following statement: "In the very short-term, the expected rate of return from investing in any bond, including risky bonds, is the risk-free rate of return".

McGuire's statement is *most* consistent with:

- A) local expectations theory.
 - B) liquidity preference theory.
 - C) unbiased expectations theory.
-

Question #56 of 71

Question ID: 1473369

The following are some of the current par rates:

Year	Par rate
1	1.00%
2	2.00%
3	3.00%
4	4.00%
5	5.00%

Using bootstrapping, the 2-year spot rate is *closest* to:

- A) 2.01%
 - B) 2.25%
 - C) 1.50%
-

Question #57 of 71

Question ID: 1473362

If the 2-year spot rate is 4% and 1-year spot rate is 7%, the one year forward rate one year from now is *closest* to:

- A) 3%
 - B) 2%
 - C) 1%
-

Question #58 of 71

Question ID: 1473375

The active bond portfolio management strategy of rolling down the yield curve is *most consistent* with:

- A) pure expectations theory.
 - B) segmented markets theory.
 - C) liquidity preference theory.
-

Question #59 of 71

Question ID: 1473416

Suppose that the short-term and long-term rates decrease by 75bps while the intermediate-term rates decrease by 30bps. The movement in yield curve is *best* described as involving changes in the:

- A)** level only.
 - B)** curvature only.
 - C)** level and curvature.
-

Question #60 of 71

Question ID: 1473364

Suppose the government spot rate curve is flat at 3%. An active manager is planning on purchasing a five-year government bond at par. The realized return on this bond will *most likely* be:

- A)** more than 3% if the bond is held to maturity while the yield curve remains flat but decreases below 3%.
 - B)** 3% if the bond is held to maturity regardless of the shape of the yield curve.
 - C)** 3% if the bond is held to maturity provided that the yield curve remains flat at 3%.
-

Question #61 of 71

Question ID: 1473404

The liquidity theory of the term structure of interest rates is a variation of the pure expectations theory that explains why:

- A)** the yield curve usually slopes downward.
 - B)** duration is an imprecise measure.
 - C)** the yield curve usually slopes upward.
-

Question #62 of 71

Question ID: 1473399

What are the implications for the shape of the yield curve according to the liquidity theory?

The yield curve:

- A)** may have any shape.
 - B)** is always flat.
 - C)** must be upward sloping.
-

Question #63 of 71

Question ID: 1473391

When the yield curve is downward sloping, the TED spread is *most likely* to be:

- A)** zero.
 - B)** positive.
 - C)** negative.
-

Question #64 of 71

Question ID: 1473397

According to the pure expectations theory, which of the following statements is *most* accurate? Forward rates:

- A)** exclusively represent expected future spot rates.
 - B)** are biased estimates of market expectations.
 - C)** always overestimate future spot rates.
-

Question #65 of 71

Question ID: 1473384

A swap spread is the difference between:

- A)** MRR and the fixed rate on the swap.
- B)** the fixed-rate and floating-rate payment rates at the inception of the swap.
- C)** the fixed rate on an interest rate swap and the rate on a Treasury bond of maturity equal to that of the swap.

Question #66 of 71

Question ID: 1473389

7.5%, 15-year, annual pay option-free Xeleon Corp bond trades at a market price of \$95.72 per \$100 par. The government spot rate curve is flat at 5%.

Suppose that the Xeleon bond was callable in 10 years at par and an analyst computed the Z-spread on the bond ignoring the embedded option. Relative to the Z-spread on an option-free bond, the calculated Z-spread will *most likely* be:

- A)** higher.
 - B)** lower.
 - C)** the same.
-

Question #67 of 71

Question ID: 1473378

Which one of the following is *least likely* a reason to use the swap rate curve?

- A)** The swap market is not regulated by any government.
 - B)** Swap rates are less volatile than government bond yields.
 - C)** Swap rates reflect credit risk of commercial banks and not government.
-

Question #68 of 71

Question ID: 1473405

Which of the following *most* accurately explains the "break-even-rate" interpretation of forward rates? The forward rate is the rate that will make an investor indifferent between investing:

- A)** for the full investment horizon, or for part of it, and then rolling over the proceeds for the balance of the investment horizon at the forward rate.
 - B)** investing at the spot or forward interest rate.
 - C)** now or at a forward time.
-

Question #69 of 71

Question ID: 1473388

Z-spread is *most accurately* described as the constant spread that is:

- A)** added to the zero volatility binomial tree such that an option-free bond is correctly valued.
 - B)** equal to the difference between a bond's yield and the yield on a government bond.
 - C)** added to the spot rate curve to generate discount rates for each of the bond's cash flows such that the present value of the cash flows is exactly equal to the market price of the bond.
-

Question #70 of 71

Question ID: 1473396

Which of the following *most accurately* explains the "locked-in-rate" interpretation of forward rates? The forward rate allows an investor to lock in:

- A)** a coupon rate for the current period.
 - B)** an interest rate for some future period.
 - C)** a coupon rate for some future period.
-

Question #71 of 71

Question ID: 1473385

For an interest rate swap, the swap spread is the difference between the:

- A)** average fixed rate and the average floating rate over the life of the contract.
- B)** fixed rate and the floating rate in a given period.
- C)** swap rate and the corresponding Treasury rate.
